

# Medical Emergencies Can Happen to Anyone Anywhere at Any Time.

## BE PREPARED WITH powered by MyNotify

for Only Pennies a Day

Did you know that in the U.S. it takes an average of **6 HOURS** for hospital personnel to reach a family member following a medical emergency?

Have you ever thought about how someone would be able to contact you if someone close to you had a **SERIOUS MEDICAL EMERGENCY** and couldn't communicate? Or how someone would get vital medical information that might be necessary to **SAVE THE LIFE OF A LOVED ONE?**

There is **NO CENTRALIZED** system in the United States that can do everything that **OnCall** does in just a few precious minutes.

- **Seventy percent of Americans no longer have a home phone (landline), which means they are no longer listed in Directory Assistance and their drivers license won't provide ANY contact information for emergency personnel.**
- **Even if your smartphone is located intact after an emergency incident, the vast majority of Americans password protect their smartphones, which means first responders would be unable to access any of their contact information.**
- **Smartphones often don't make it into the ER with the patient after a serious medical emergency, plus it is considered a HIPAA violation for hospital personnel to go into your phone to search for contact information.**
- **Even under the best circumstances, first responders or hospital personnel will likely only notify one (1) person following a serious medical emergency. Get PEACE OF MIND that OnCall will immediately contact up to nine (9) pre-determined individuals for you or your family member.**

### How Works

**STEP 1**

A first responder checks for information on your driver license or passport and finds the reflective ID sticker. They immediately contact the call center and provide the ID code listed on the sticker plus other vital information such as the name of the receiving hospital.

**STEP 2**

An on call advisor at one of the 22 emergency call centers jumps into action to quickly analyze the situation by providing lifesaving information to medical personnel by email or fax. (Call center advisors have multilingual capabilities and are equipped to provide your medical information in any one of 75 languages.)

**STEP 3**

An advisor then notifies your pre-designated contacts (up to 9 individuals) via phone, email, text, or all three, to let them know an event has occurred and provide more details.
